# Overview

- Introduction and context
- Data measurement and monitoring
- Clinical strategies for reducing inhaler emissions
- Implementing clinical strategies
- Insights from clinical pharmacy
- Questions/Discussion

# Introduction and context

# Inhaler device types

# Pressurized metered dose inhaler (MDI)

- Most commonly used inhaled drug delivery device in the US
- Pressurized propellant expels medication from the device into the upper airway
- Used to treat the two most common respiratory conditions: asthma and COPD

# Propellants in MDIs are potent GHGs

- Two hydrofluorocarbon propellants
  - HFA134a: GWP<sub>100</sub> 1530
  - HFA227ea: GWP<sub>100</sub> 3600
- 144 million MDIs sold in the US in 2020
  - 70% of all inhaled drug delivery devices sold in US
  - 2.5 MMT CO<sub>2</sub> Eq
  - Equivalent to ~ 550,000 cars driven for a year

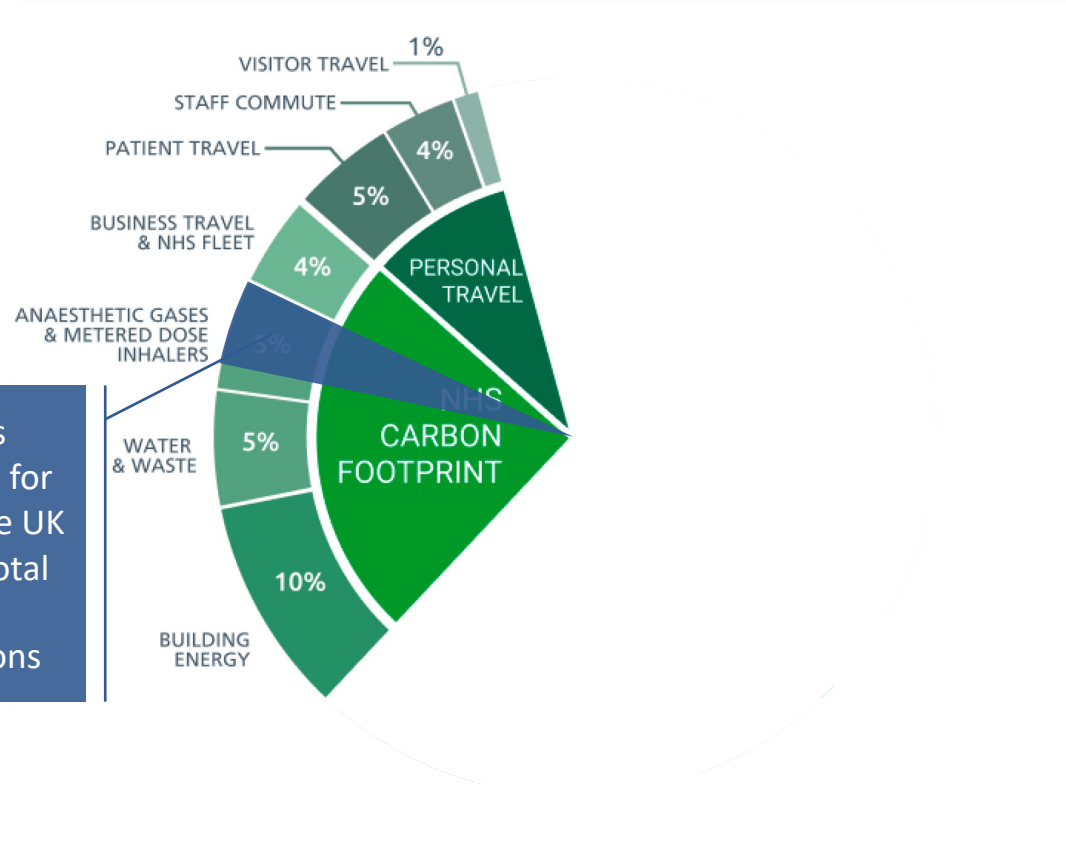

45% of GSK's  
total GHG  
emissions

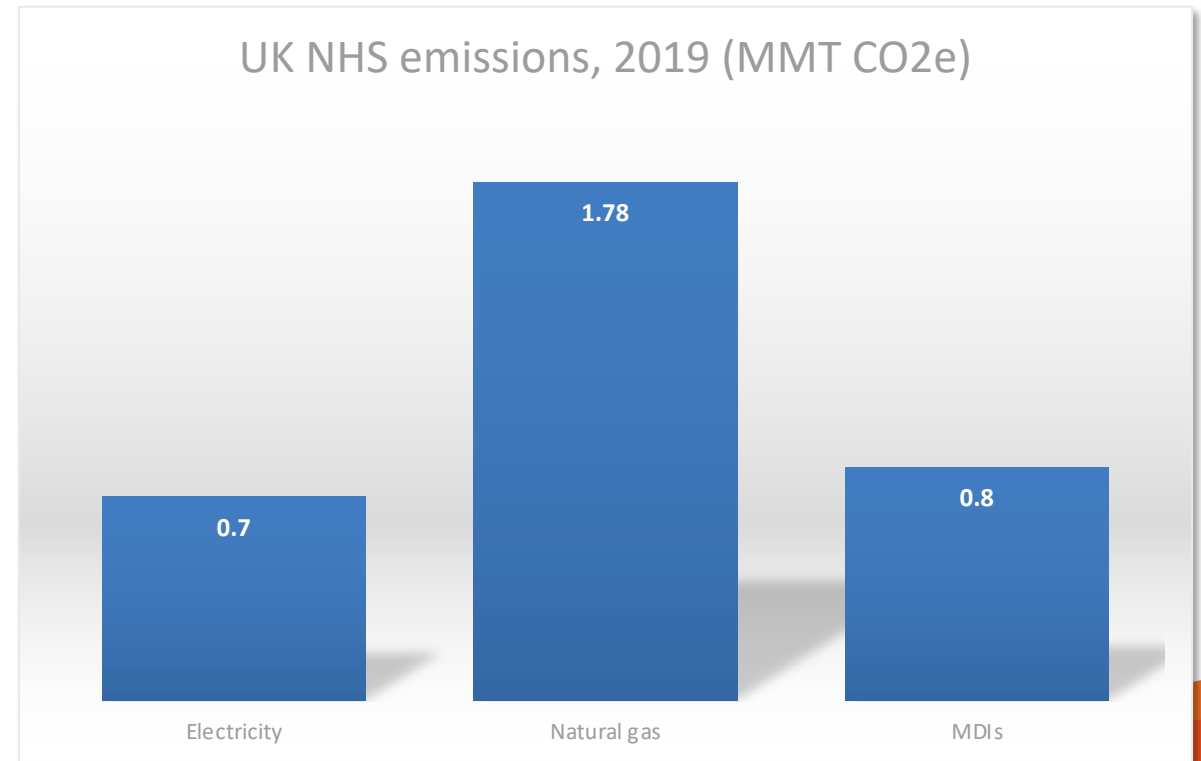

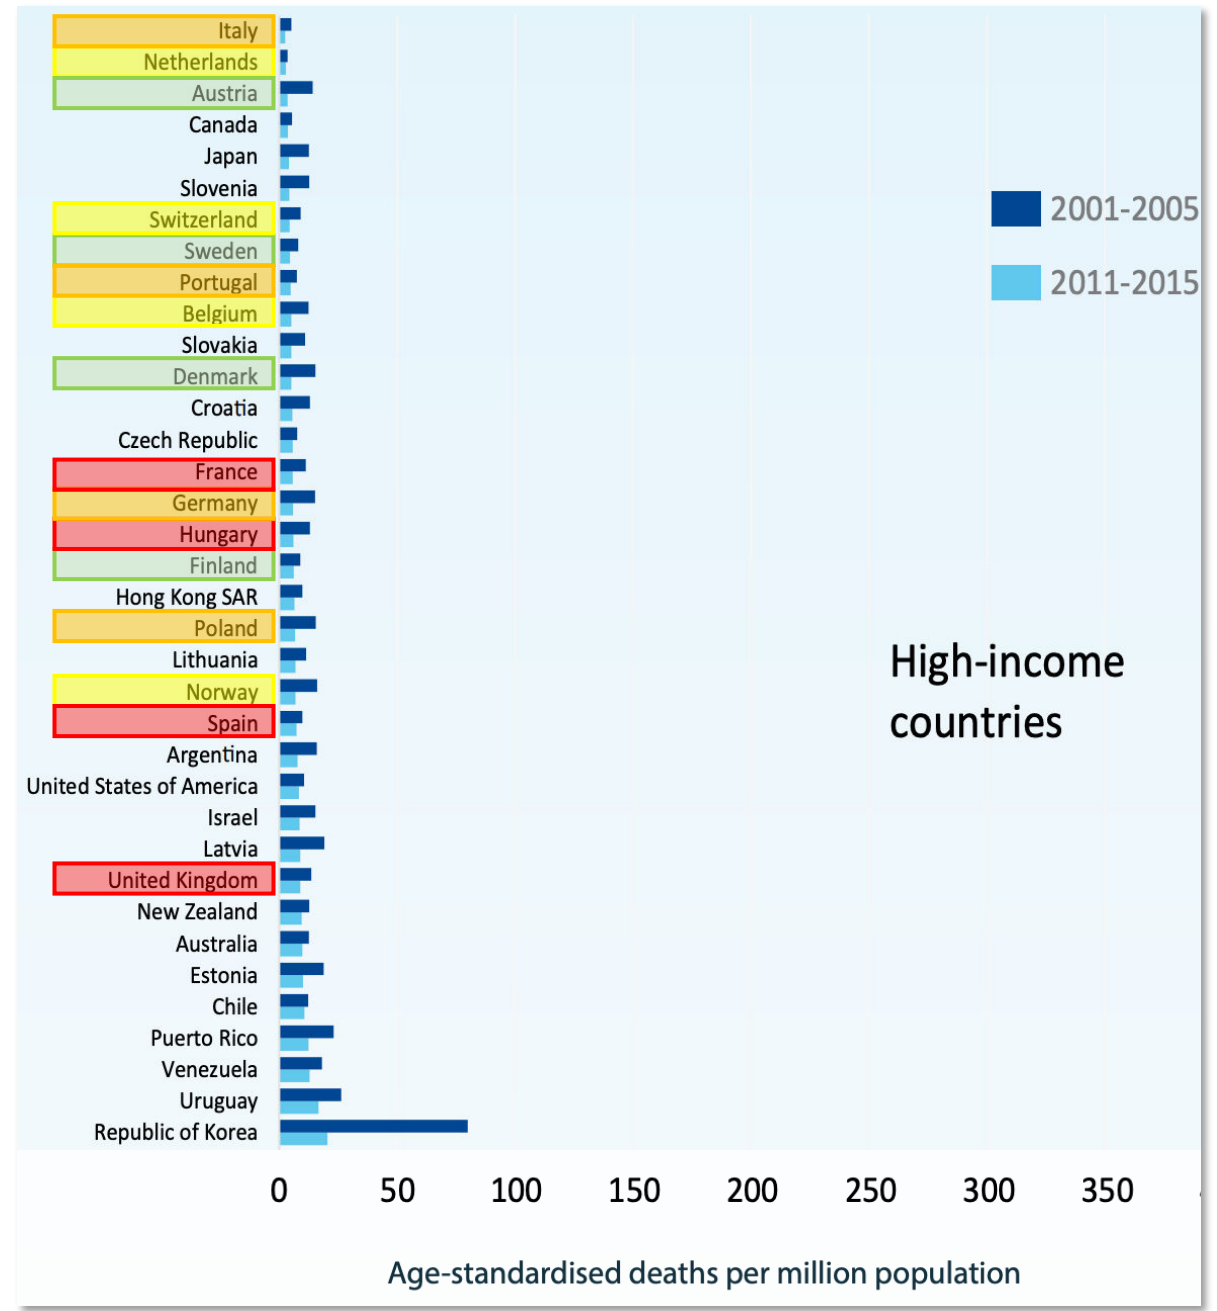

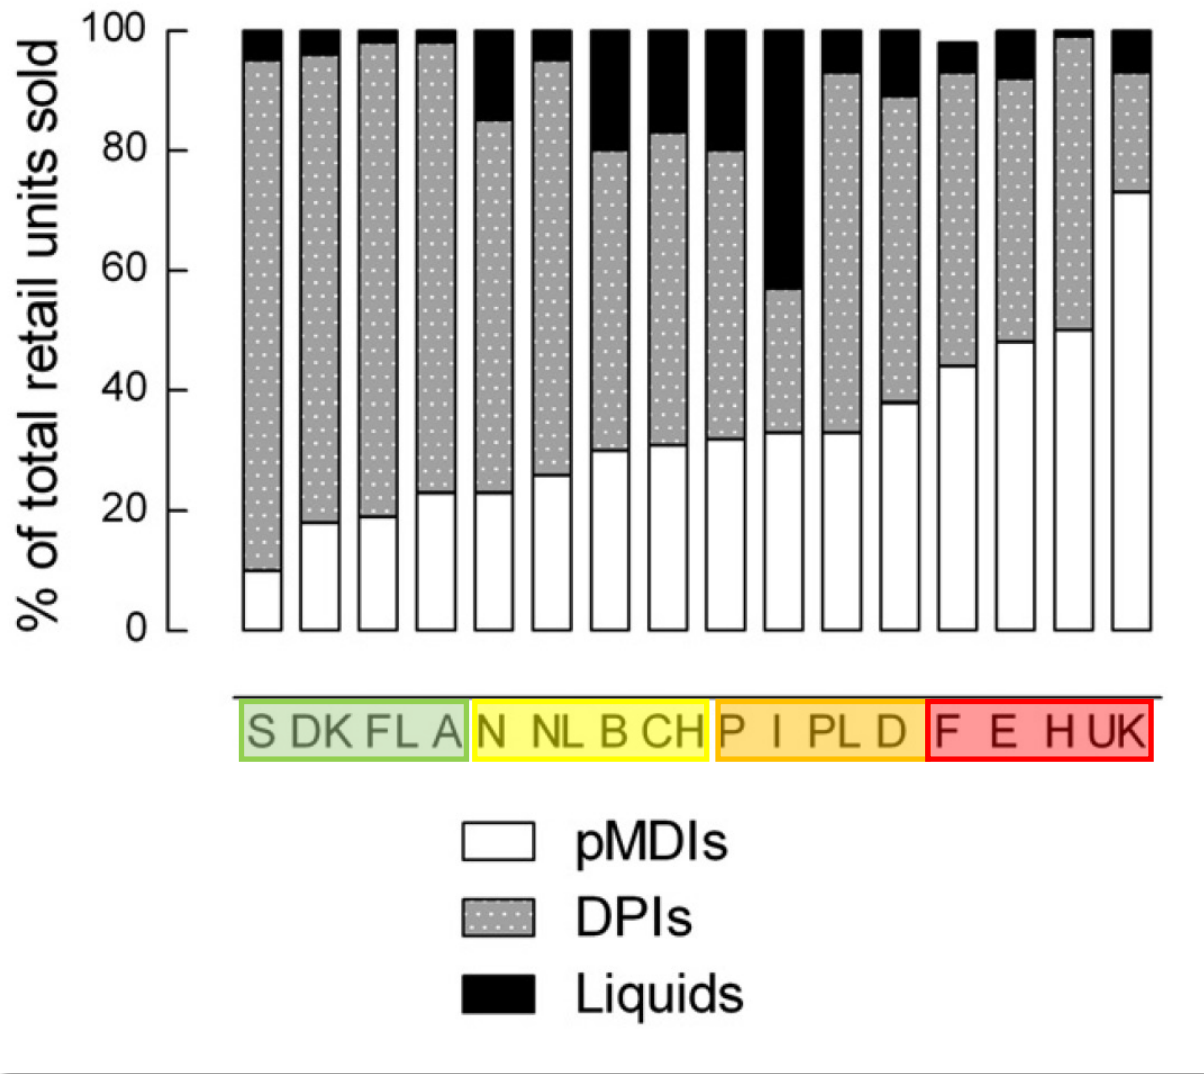

12% of  
AstraZeneca's total  
GHG emissions

# MDIs make a significant contribution to emissions that are under health systems' direct control

MDIs account for 4% of the UK NHS's total GHG emissions

# Pathway to reducing MDI emissions

# Clinical strategies

# GHG Emissions and Costs of Inhaler Devices in the US

---

We assessed individual emissions and costs and total yearly emissions and costs for US brand-name inhalers prescribed to Medicare Part D and Medicaid beneficiaries in 2022.

---

Medicare Part D and Medicaid account for approximately 40% of US retail prescription drug spending.

# GHG Emissions and Costs of Inhaler Devices in the US

## RESEARCH LETTER

---

### CLIMATE CHANGE AND HEALTH

## Greenhouse Gas Emissions and Costs of Inhaler Devices in the US

JAMA Published online August 29, 2024

- Inhalers prescribed to CMS beneficiaries in 2022 accounted for 1.15 MMT CO<sub>2</sub>e emissions.
- Nearly all inhaler-related emissions 1.13 MMT (98.3%) came from metered-dose inhalers.
- Metered dose inhalers made up 70% of claims (49 million claims).

# Inhaler Prescriptions and Emissions in the US

- The largest contribution of emissions arose from short-acting beta agonists.
- Albuterol alone made up 72% of MDI claims (35.3 million claims).
- Dry-powder inhalers accounted 24.5% of total inhaler claims.
- Soft-mist inhalers were prescribed the least (5.2% of total claims).

# Putting It All Together

Figure. Claims, Estimated Greenhouse Gas Emissions, and Spending for All Inhalers Filled by Medicare Part D and Medicaid Beneficiaries in 2022 by Device Class

Number of claims, estimated greenhouse gas emissions, and spending for inhalers by device class are shown for Medicare Part D and Medicaid beneficiaries from January 2022 through December 2022. CO<sub>2</sub>e indicates carbon dioxide equivalent; MMT, million metric tons.

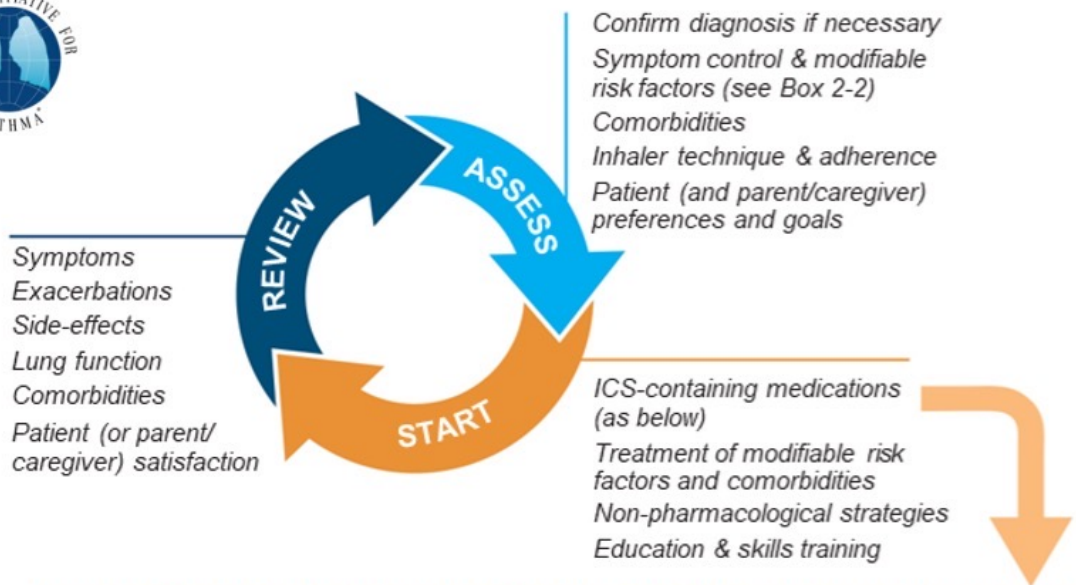

MDIs=70% of claims and 38% of spending  
\$7.5 billion

DPIs= 25% of claims and 51% of spending  
\$10 billion

# GINA 2024 – STARTING TREATMENT

in adults and adolescents 12+ years with a diagnosis of asthma

These recommendations are based on the (little) available evidence and consensus

IF the patient has:	START WITH:	TRACK 1 (preferred)	OR	TRACK 2	
Daily symptoms, waking at night once a week or more and low lung function, or recent exacerbation	YES	Medium dose ICS-formoterol maintenance and reliever (MART)		Medium/high dose ICS-LABA + as-needed SABA (or ICS-SABA)	<b>STEP 4</b> .... <i>Short course of OCS may also be needed for patients presenting during an exacerbation</i>
NO					
Symptoms most days, or waking at night once a week or more, or low lung function	YES	Low dose ICS-formoterol maintenance and reliever (MART)		Low dose ICS-LABA + as-needed SABA (or ICS-SABA)	<b>STEP 3</b>
NO					
Symptoms less than 3–5 days a week, with normal (or mildly reduced) lung function	YES	As-needed-only low dose ICS-formoterol		Low dose ICS + as-needed SABA (or ICS-SABA)	<b>STEP 2</b> .... <i>In patients with symptoms 1–2 days a week or less, adherence with daily ICS would be very poor, so taking low-dose ICS whenever SABA is taken could reduce the risk of exacerbations</i>
				Take low dose ICS whenever SABA is taken	<b>STEP 1</b>

# Inhaler choice and environmental considerations

- Inhaled corticosteroids markedly reduce the risk of asthma exacerbations and death
  - But limited availability and access in low and middle income countries
- Many inhaler types available, with different techniques
- Some inhalers are not suitable for some patients. For example:
  - DPIs are not suitable for children  $\leq 5$  years and some elderly
  - pMDIs difficult for patients with arthritis or weak muscles
  - Capsule devices are difficult for patients with tremor
- Most patients don't use their inhaler correctly
  - More than one inhaler  $\rightarrow$  more errors
- Incorrect technique  $\rightarrow$  more symptoms  $\rightarrow$  worse adherence  $\rightarrow$  more exacerbations  $\rightarrow$  higher environmental impact
- Propellants in current pMDIs have 25x global warming potential compared with dry powder inhalers
  - New propellants are being developed but not yet approved
- Choice of inhaler is important!

# Inhaler choice and environmental considerations

- First, what is the right medication for this patient?
  - Control symptoms and reduce exacerbations
  - Urgent healthcare and hospitalization have a heavy environmental burden
- Which inhaler(s) can the patient access for this medication?
  - Low/middle income countries often have limited choice and access
  - Cost of inhalers is a major burden
- Which of these inhalers can the patient use correctly?
  - Incorrect technique → more exacerbations
- What are the environmental implications of these inhaler(s)?
  - Manufacture
  - Propellant (for pMDIs)
  - Recycling potential
- Is the patient satisfied with the treatment and the inhaler?
  - Consider the patient's environmental priorities
  - Avoid 'green guilt', which may contribute to poor adherence
  - Check inhaler technique frequently

For this patient, which is the right class of medication?

⋮

For these medications, which inhalers are currently available to the patient?

Which of these inhalers can the patient use correctly after training?

Which of these inhalers has the lowest environmental impact?

**OPTIMAL INHALER SELECTION**  
Safest and best for the patient and for the planet

Follow-up:  
Is the patient satisfied with the medication(s) and inhaler(s)?

# Lowering Inhaler-Related Emissions in the US – Lack of MART Options

- Dry powder Symbicort available in Europe/Canada but not in US, making it difficult to implement inhaler decarbonization in the US while following GINA guidelines.
- DPIs in US more expensive and often not preferred under many insurance plans – exception is generic fluticasone-salmeterol (Wixela Inhub).

# Lowering Inhaler-Related Emissions in the US – Higher Costs

- DPIs in US more expensive and often not preferred under many insurance plans – exception is generic fluticasone-salmeterol (Wixela Inhub).
- In those who cannot be on GINA track 1 preferred treatment – consider DPIs, lower emissions MDIs, and SMIs if out-of-pocket cost acceptable.

# Lowering Inhaler-Related Emissions in the US – Short Acting Bronchodilator Choice

- Consider DPI albuterol – ProAir Respiclick or lower emissions albuterol HFA.
- Brand/generic Ventolin HFA has approximately 3 times the emissions of brand/generic Proventil HFA.

Proventil HFA:  
9.9 kg CO<sub>2</sub>e emissions  
per inhaler

Ventolin HFA:  
28.1 kg CO<sub>2</sub>e emissions  
per inhaler

# Is Inhaler Therapy Indicated?

- Does the patient have a confirmed diagnosis of asthma that requires long-term use of an inhaler?
- Asthma and COPD guidelines recommend pulmonary function testing to demonstrate airflow obstruction.
- Avoid automatic refills for those without a confirmed diagnosis.

# Better Asthma and COPD Control

- Provide preventative care and more frequent follow up for asthma and COPD patients with frequent exacerbations.
- Consider stepping up treatment to improve control.
- Refer to an allergist or pulmonologist to consider biologics.

# The Future of Inhaler Propellants

---

Next generation propellants with low or “zero” emissions propellants coming.

---

HFA 152a a new, low global warming potential (LGWP) medical propellant, developed for Ventolin.

---

Lower emissions Ventolin (GSK) in phase III trials in the US currently.

---

Aztra Zeneca has completed phase III trials for LGWP propellant for Breztri in Europe.

---

Honeywell’s Solstice Air (HFO-1234ze) has 99.9% less GWP than propellants currently used in inhaled respiratory medicines.

---

**These inhalers will come with new patents on old medications and higher prices!**

## A note about greenhouse gases

The propellants currently used in HFA metered dose inhalers (MDIs) are potent greenhouse gases and have 20- to 30-fold higher carbon footprint than alternatives like dry powder inhalers (DPIs). Some options to consider, in addition to robust education regarding prevention, allergen/irritant/pollution avoidance:

- Whenever equal treatments are available in multiple formations, if feasible with considerations for cost and patient abilities (patients need inspiratory force for DPI use), avoid current HFA MDIs.
- If HFA MDI is prescribed, choose the lower gram canister of equivalent actuations to deliver the same amount of medication but with less HFA propellant, and ensure proper use with spacer. For example, the albuterol formulations often vary in grams (6.7g, 8.5, 18g), but deliver the same amount of albuterol per actuation and contain the same number of actuations. In these cases, the difference in weight is mostly HFA propellant.
- Choose inhalers with actuation counters, if possible, and confirm proper inhaler technique and spacer use.

Ultimately, good control of asthma is not only best for the patient, but also better for the environment.

## 8 Actions to Reduce MDI-Associated Emissions

1. Do not prescribe albuterol or ipratropium for URIs or acute bronchitis in patients without a history of asthma or COPD.
2. Prescribe dry powder inhalers (DPIs) or soft mist inhalers (SMIs) instead of MDIs for appropriate patients.
3. When prescribing albuterol MDIs, choose 6.7 g or 8.5 g canisters rather than the 18 g canister when possible. The 18 g canister is associated with 2 to 3 times greater emissions and has roughly the same climate impact as an automobile driven for 65 miles
4. Prevent excessive albuterol use by optimizing inhaled corticosteroid-containing asthma regimens for patients with poorly controlled asthma. Use of three or more albuterol canisters per year is a marker of poor disease control.
5. Limit albuterol prescriptions to 3 devices (or 1 device with 2 refills) in order to more-easily identify patients using excessive amounts of albuterol.
6. Do not prescribe two puffs of a metered-dose inhaler when the same dose of medication can be delivered with one puff (ie, one puff fluticasone propionate 220 mcg/inh vs two puffs fluticasone propionate 110 mcg/inh).
7. Confirm the diagnosis of COPD with pulmonary function testing before committing a patient to long-term therapy. A diagnosis of asthma should ideally be confirmed with pulmonary function testing prior to committing a patient to long term therapy. However, a diagnosis of probable asthma can be made in patients with characteristic symptoms for whom spirometry is not readily available or who do not have airflow obstruction at the time of pulmonary function testing.
8. Ensure proper inhaler technique.

**Healthcare Sustainability - Transforming Clinical Practice in the Face of Climate Change**

From an accredited US hospital >

Harvard Medical Grand Rounds 2023-2024  
"Healthcare Sustainability – Transforming Clinical Practice in the Face of Climate Change"  
Thursday, October 5, 2023 | 8:00 – 9:00 am

**Learning Objectives**  
Upon completion of this activity, participants will be able to:

- Recognize the U.S. healthcare sector's substantial contribution to climate change, using data from Mass General Brigham's comprehensive audit of its own carbon emissions.
- Understand how clinical activities drive carbon emissions and represent opportunities for mitigation through the use of two examples relevant to internal medicine: single-use vs reusable products and low emission asthma care.

**Target Audience**  
This activity is intended for physicians, scientists, and researchers.

**Course Directors**  
Jose C. Florez, MD, PhD (Massachusetts General Hospital)  
Eileen E. Reynolds, MD (Beth Israel Deaconess Medical Center)  
Joel T. Katz (Brigham and Women's Hospital)  
Rebecca M. Baron (Brigham and Women's Hospital)

**Speaker/Faculty**  
Gregg Furie, MD, MHS  
Preeti Mehrotra, MD, MPH  
Wynne Armand, MD

Details

Asthma Smart Rx – Adults (18+)

Last updated February 2025

1. Global Initiative for Asthma (GINA) Guidelines
  - **NEW:** Treatment with only a short-acting beta-agonist (SABA) is no longer recommended due to increased exacerbation risk and mortality.
  - Inhaled corticosteroids (ICS) are essential for controlling inflammation and preventing exacerbations, regardless of disease severity.
  - GINA recommends ICS for all patients, with two treatment tracks:
    - **Track 1 (preferred):** ICS-formoterol (no SABA) for both relief and control, used as-needed or with daily maintenance based on severity.
    - **Track 2 (alternative):** Begins with as-needed ICS taken alongside SABA in Step 1, then transitions to **daily ICS with as-needed SABA** in later steps. *An option for those with limited access to ICS-formoterol.*
  - Treatment is adjusted stepwise based on symptoms and risk.
2. Refer to an asthma specialist if symptoms persist despite correct inhaler use and adherence to Step 4

The screenshot shows a clinical software interface with a navigation bar at the top containing 'Encounters', 'Labs', 'Imaging', 'Procedures', 'Surgery', 'Anesthesia', 'Cardiology', 'Neurology', 'Meds', 'Notes', 'Letters', and 'Misc Reports'. Below the navigation bar, there is a table of reports. The 'Medication Dispense History' report is selected and highlighted in blue. To the right of the report list, a detailed view of the medication dispense history is shown, listing 'albuterol sulfate' with columns for 'Dispensed', 'Supply', and 'Quantity'. The data is as follows:

	Dispensed	Supply	Quantity
ALBUTEROL HFA 90 MCG INHALER	01/25/2024	30	18 g
ALBUTEROL HFA 90 MCG INHALER	02/26/2021	25	8.5 g
PROAIR HFA 90 MCG INHALER	04/19/2020	30	8.5 g
PROAIR HFA 90 MCG INHALER	03/22/2020	30	8.5 g

- Confirms adherence
- Overuse identification, population-level opportunities
- **Limitations: eg, out-of-pocket payment**

# Insights from clinical pharmacy

Do you know how your inhalers are disposed of after patient use?

Do you know how your inhalers are disposed of after patient use?

Is 'sustainability' listed as a criterion in a P&T formulary review?

# MDI Vs Nebulizer

Inhaler Type	Propellant Use	CO2e Impact	Ease of Use	Time to Administer	Cost	Common Pitfalls
<b>Metered-Dose Inhaler (MDI)</b>	Yes HFA-134a, 227ea	High 12 - 25 kg CO2e per inhaler	<b>Moderate</b> requires coordination	<b>Fast</b>	\$	Poor technique
<b>Nebulizer</b>	No	<b>Very Low</b>	<b>Easy</b> <b>passive delivery</b>	Long 10–15 min	\$	Not portable Needs power Poor technique

## Assumptions 500 Bed Hospital

---

- 20% patients on albuterol (n=100)
- Dose = 4x / day
- Administration Time = 20 minutes
- RT Salary = \$80,000

## Impact 20 NEW Respiratory Therapists

---

- 400 treatments daily
- ~130 hours / day

Cost \$1.64M

---

Talent shortage is a big concern for the future. A big reason for that? Retirement plus fewer and fewer incoming RTs.

## Troubling trends in respiratory therapy

**92,474**

RTs will leave the profession by 2030<sup>2</sup>

**27%**

decline in respiratory care education program enrollment since 2010<sup>2</sup>

How does  
your  
institution  
dispose of  
inhalers?

## Replacing Your PROAIR HFA Device

- **When the dose counter on the actuator says the number 20,** the color of the numbers will change to red. The red numbers are to remind you to refill your prescription or ask your doctor for another prescription for PROAIR HFA. When the dose counter reaches **0**, the background color will change to solid red.
- **Throw the PROAIR HFA inhaler away** as soon as the dose counter says **0** or after the expiration date on the PROAIR HFA packaging, whichever comes first. You should not keep using the inhaler after 200 sprays even though the canister may not be completely empty. You cannot be sure you will receive any medicine after using 200 sprays.
- **Do not use the inhaler** after the expiration date on the PROAIR HFA packaging.

This Patient Information and Instructions for Use has been approved by the U.S. Food and Drug Administration.

Marketed by Teva Respiratory, LLC  
Frazer, PA 19355

A photograph of an industrial facility, likely a pharmaceutical manufacturing plant, with a large pile of discarded inhaler canisters in the foreground. The facility features large metal buildings, complex piping, and a tall smokestack emitting a plume of white smoke. The sky is overcast and grey. The text is overlaid in white on the image.

~30-50% of the inhaler's  
propellant remains after  
clinical use ends\*

*\*Dose counter at zero in an albuterol MDI*

*AJHSP 2025;; zxae384*

# Disposal Pathways & Environmental Impact

**Why aren't inhalers currently recycled in the U.S.?**

Pressurized canisters = explosion risk in standard recycling

No national infrastructure for inhaler recycling exists  
GSK "Complete the Cycle" discontinued 2020

**Take-Back Programs in Europe**

*Take AIR (Murphy et al)*

12-month pilot collected 1800 inhalers (UK)

Diverted 119 tonnes of CO<sub>2</sub>e by recovery and recycling of HFAs

**What's the best available disposal method today?**

Medical waste incineration to destroy residual HFA propellant

>1200 F (650 C)

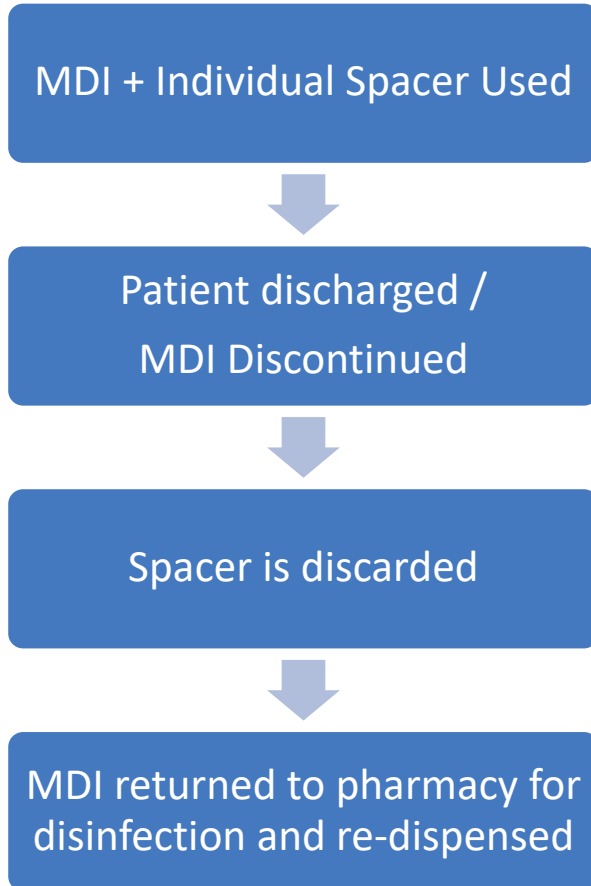

# Common Canister

*Using a single MDI canister to administer the medication to multiple patients.*

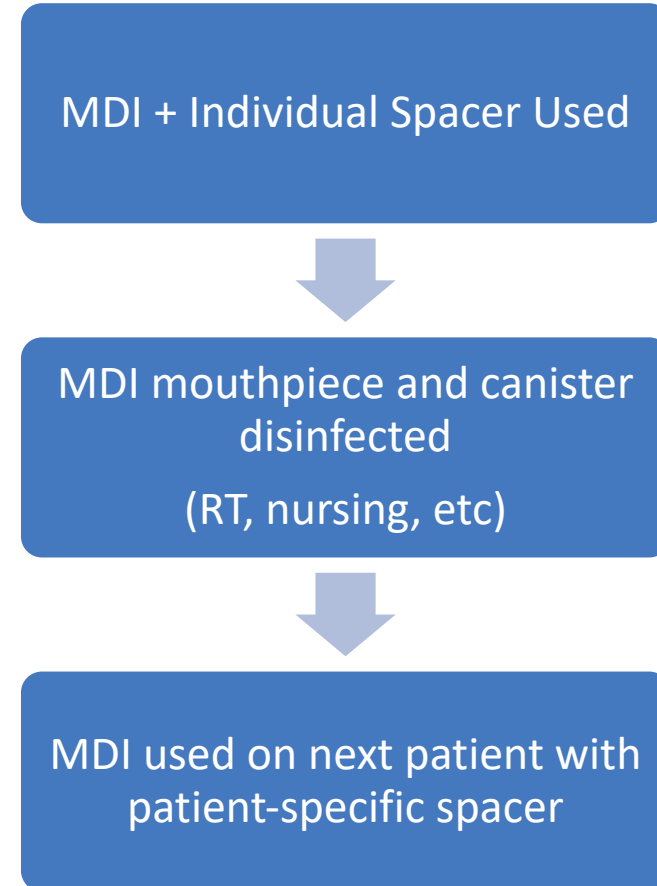

*The medication is delivered utilizing a patient specific spacer with a one-way valve.*

## Method 1 – Pharmacy Disinfection

## Method 2 – Point of Care Disinfection

**Excludes:** Mechanically ventilated patients, isolation patients, emergency department, MDIs that don't work with a spacer, hospice patients, behavioral health patients, neutropenic patients, procedural areas

# Stakeholders to Engage

Billing / Revenue Integrity

# Use & Disposal Scenario

60 Metered Doses

2 Puffs BID (15 days)

HFA-227ea propellant

24.6 kg CO<sub>2</sub>e / inhaler

## Single Use / Landfill

CO2e: 24,600 kg

Inhalers: 1,000

## Common Canister / Landfill

CO2e: 11,340 kg

Inhalers: 500

Emissions: ↓50%

## Sustainability vs Simplicity

## Single Use / Incineration

CO2e: 12,300

Inhalers: 1,000

Emissions: ↓50%

## Common Canister / Incineration

CO2e = 5,855 kg

Inhalers: 500

Emissions: ↓75%

# Final Takeaways

## **Best immediate strategy:**

Use incineration over landfilling inhalers to prevent residual HFA emissions.

## **Better formulary alignment:**

Purchase lowest weighted inhalers (eg 6.7g vs 18g)

## **Common canister model:**

Strong environmental benefits but requires infection control & resource management.

**Interdisciplinary collaboration is key to successfully reducing our carbon footprint**
